

Ask Your Provider for The Octave MSDA Test

During my next visit, I want to discuss adding a new biomarker blood test to my treatment plan. The Octave Multiple Sclerosis Disease Activity (MSDA) Test measures disease activity based on the levels of 18 proteins in the blood.

Based on their website, the test is available to order for people living with MS.

The Octave MSDA Test can be used throughout the MS journey starting from when someone is diagnosed with MS, to seeing if treatment is working, to determining if a patient is having a relapse, and can be used to monitor a patient that decides to discontinue treatment.

This is interesting for me since I want more information about the activity of my

disease and I believe having this information will give me more confidence in how I am doing and if everything is working.

When visiting the company's website, you will find a number of research studies validating the test, which help show how the test is used to deliver more personalized care.

I believe this test could be beneficial for my journey, and may also help other patients in your care.
